IMPORTANT PLEASE READ:

- The information, specifications and illustrations in this manual are based on the latest information available at the time of printing. The manufacturer reserves the right to make changes at any time without notice.
- This manual is intended as a guide for service of the valve only. System installation requires information from a number of suppliers not known at the time of manufacture. This product should be installed by a plumbing professional.
- This unit is designed to be installed on potable water systems only.
- This product must be installed in compliance with all state and municipal plumbing and electrical codes. Permits may be required at the time of installation.
- It is established that when daytime water pressure is above 80 psi [5.5 bar], the maximum pressure rating of 125 psi [8.6 bar] can be exceeded. A pressure regulator must be installed on this system or warranty is voided.
- Do not install the unit where temperatures may drop below 32°F [0°C] or above 125°F [52°C].
- Do not place the unit in direct sunlight. Black units will absorb radiant heat increasing internal temperatures.
- Do not strike the valve or any of the components.
- Warranty of this product extends to manufacturing defects. Misapplication of this product may result in failure to properly condition water, or damage to product.
- A prefilter should be used on installations in which free solids are present.
- In some applications local municipalities treat water with Chloramines. High Chloramine levels may damage valve components.
- Correct and constant voltage must be supplied to the control valve to maintain proper function.

CALIFORNIA PROPOSITION 65 WARNING

WARNING: This product contains chemicals known to the State of California to cause cancer or birth defects or other reproductive harm.
# JOB SPECIFICATION SHEET

**NOTE:** Some options may not be available depending on valve model or other options chosen.

Circle and/or fill in the appropriate data for future reference.

1. **System Type:**
   - A. Meter Immediate
   - B. Time Clock Delayed
   - C. Volume Override Delayed
   - D. Volume Override Immediate
   - E. Meter Delayed Weekly Reserve
   - F. Meter Delayed Variable Reserve
   - G. Meter Delayed Fixed Reserve

2. **Valve Type:**
   - A. 7000XTR

3. **Regenerant Flow:**
   - A. Downflow
   - B. Filter
   - C. Downflow Fill First

4. **Display Format:**
   - A. U.S.
   - B. Metric [French Degrees, German Degrees, or PPM]

5. **Unit Capacity:**
   - ________Grains/French Degrees/German Degrees/PPM

6. **Water Hardness:**
   - ________Grains/French Degrees/German Degrees/PPM

7. **Capacity Safety Factor:**
   - A. Zero
   - B. ________%

8. **Volume Override:**
   - ________[Gallons or M³]

9. **Regeneration Day Override:**
   - A. Off
   - B. Every ________Days

10. **Regeneration Time:**
    - A. Delayed ________AM/PM
    - B. ________Immediate

11. **Regeneration Cycle:**
    - A. Step #1 ________
    - B. Step #2 ________
    - C. Step #3 ________
    - D. Step #4 ________
    - E. Step #5 ________
    - F. Step #6 ________

12. **Auxiliary Relay:**
    - A. Enabled
      - a. Auxiliary Relay Start 1 ________
      - b. Auxiliary Relay End 1 ________
      - c. Auxiliary Relay Start 2 ________
      - d. Auxiliary Relay End 2 ________
    - B. Disabled

13. **Chemical Pump:**
    - A. Enabled
    - B. Disabled

14. **CPO Aux Relay Volume:** ________[Gallons or M³]

15. **CPO Aux Relay:** ________

16. **Flow Meter Size:** 1.25-inch Turbine

17. **Generic Flow Meter for Maximum Flow Rate:**
    - Add ________Gallons every ________Pulses
WATER SOFTENER CONTROL VALVE

Water Pressure
A minimum of 20 psi (1.3 bar) inlet water pressure is required for regeneration valve to operate effectively.

Electrical Facilities
An uninterrupted alternating current (A/C) supply is required. Make sure:
- Voltage supply is compatible with unit before installation.
- Current supply is always hot and cannot be turned off with another switch.

Existing Plumbing
Condition of existing plumbing should be free from lime and iron buildup. Replace piping that has heavy lime and/or iron build-up. If piping is clogged with iron, install a separate iron filter unit ahead of the water softener.

Location of Softener and Drain
Locate the softener close to a clean working drain and connect according to local plumbing codes.

Bypass Valves
Always provide for the installation of a bypass valve if unit is not equipped with one.

CAUTION
- Minimum Water pressure 20 psi.
- Maximum water pressure 125 psi.
- Minimum water temperature 34°F.
- Maximum water temperature 110°F.
- Ambient temperature 34° to 122°F (1° to 50°C).
- Disconnect all power sources before servicing.
- Always operate with cover in place.

NOTE: This product should be installed by qualified personnel.
NOTE: Comply with all plumbing codes when installing this product. Comply with all electrical codes when installing this product.

WARNING: The system MUST be depressurized before removing any connections for servicing.

VALVE INSTALLATION AND START-UP PROCEDURES

Installation Instructions
1. Place the softener tank where you want to install the unit.
NOTE: Be sure the tank is level and on a firm, clean base.
2. Perform all plumbing according to local plumbing codes.
3. Cut the 1.05 inch (2.6 cm) distributor tube flush with the top of the tank (A). Deburr the outside of the tube (B) after cutting. Lubricate the o-ring (C) with non-petroleum based grease.

4. Lubricate the distributor o-ring seal and tank o-ring seal. Use only non-aerosol silicone lubricant.
5. Load media and place the control valve on the tank.
6. All soldering MUST be done on any connections requiring soldering prior to connecting the main control valve. The main control valve will be damaged if it is connected at the time of soldering.
7. Apply plumber tape to all threaded fittings.
8. On units with a bypass, place in Bypass position. Turn on the main water supply. Open a cold soft water tap nearby and let water run a few minutes or until the system is free of foreign material (usually solder) resulting from the installation. Close the water tap when water runs clean.
9. Make plumbing connections to valve.
10. Plug the valve into an approved power source.

NOTE: Make all electrical connections according to codes.

11. Place the bypass In Service position. Cycle the valve to the Backwash position, and let the water flow slowly into the mineral tank until the air is purged from the unit.
12. Add water to the brine tank until the top of the air check is covered. Manually step the valve to the Brine Draw Position, and allow the valve to draw water from the brine tank until it stops.

NOTE: The air check will check at approximately the midpoint of the screened intake area.

13. Manually step the valve to the Brine Refill Position, and allow the valve to return to In Service automatically.
14. With the valve In Service, check that there is at least 1 inch (2.5 cm) of water above the grid in the brine tank, if used.
15. Fill the brine tank with salt.
16. Allow the control to run automatically. Setup is now complete.
Valve State

INI (Initializing)
INI will display on the screen for 30 to 45 seconds when initializing after a power failure reset or programming.

RGQ (Regeneration Queued)
RGQ indicates that the reserve has been entered in a delayed system and regeneration has been queued. When in the main screen, press the Shift button to toggle service (SRV) with RGQ.

Service (SRV)
SRV will display when the unit is in service.

LED Status Lights

Blue LED
Illuminates while the unit is in service and no errors exist. The unit will always be in service unless a regeneration trigger has occurred (green LED light will be displayed).

Green LED
Illuminates when the unit is in Regeneration mode, unless an error condition exists.

Red LED
Illuminates when there is an error.

Flow Indicator
A rotating line (appearing as a rotating star shape) will display on the screen when flow is going through the meter.

System Type | Regeneration Trigger
---|---
Time Clock Delayed | A) Day override parameter is reached and B) the time of day matches the regeneration day override time

Meter Immediate | Regenerates as soon as the volume remaining has been depleted

Meter Delayed Fixed Reserve | A) Volume remaining has been depleted to the fixed reserve volume and B) the regeneration time has been reached

Meter Delayed Variable Reserve | A) Volume remaining has been depleted to the variable reserve volume and B) the regeneration time has been reached

Meter Delayed Weekly Reserve | A) Volume remaining has been depleted to the weekly variable reserve volume and B) the regeneration time has been reached

Volume Override Immediate | As soon as the programmed volume remaining has been depleted from the tank

Volume Override Delayed | As soon as the programmed volume remaining has been depleted from the tank and the regeneration time has been reached

Setting the Time of Day
1. Press and hold the Up or Down button for 2 seconds.
2. Press the Shift button to select the digit you want to modify.
3. Press the Up or Down buttons to adjust the value.
4. Press the Extra Cycle button to return to the normal display screen, or after a 5 second timeout.

NOTE: The ”D” button (Diagnostic) can be pressed to exit without saving.

Manually Initiating a Regeneration
1. When timer is in service, press the Extra Cycle button for 5 seconds on the main screen.
2. The timer advances to Regeneration Cycle Step #1, and begins programmed time count down.
3. Press the Extra Cycle button once to advance valve to Regeneration Cycle Step #2 (if active).
4. Press the Extra Cycle button once to advance valve to Regeneration Cycle Step #3 (if active).
5. Press the Extra Cycle button once to advance valve to Regeneration Cycle Step #4 (if active).
6. Press the Extra Cycle button once to advance valve to Regeneration Cycle Step #5 (if active).
7. Press the Extra Cycle button once to advance valve to Regeneration Cycle Step #6 (if active).
8. Press the Extra Cycle button once more to advance the valve back to in service.

NOTE: A queued regeneration can be initiated by pressing the Extra Cycle button. To clear a queued regeneration, press the Extra Cycle button again to cancel. If regeneration occurs for any reason prior to the delayed regeneration time, the manual regeneration request shall be cleared.
Queued Regeneration (RGQ)
From the display screen, while the unit is in service, hold down the Extra Cycle button until "RGQ" displays. The valve will regenerate when the set regeneration time has been reached.

Timer Operation During Regeneration
In the main display screen, the timer shows the current regeneration cycle and the time for that step. The green LED light will display when the unit is in regeneration. Once all regeneration steps are complete, the timer returns to service, and displays a blue LED light.

Timer Operation During Programming
The timer enters program mode (unit must be in service). While in the program mode the timer continues to operate normally, monitoring water usage. Timer programming is stored in memory permanently upon a normal exit from programming mode.

Timer Operation During A Power Failure
All program settings are stored in permanent memory. Current valve position, cycle step time elapsed, and time of day are stored during a power failure, and will be restored upon power re-application. Time is kept during a power failure, and time of day is adjusted upon power up (as long as power is restored within 12 hours).

NOTE: The time of day on the main display screen will flash for 5 minutes when there has been a power outage. The flashing of the time of day can be stopped by pressing any button on the display.

Regeneration Day Override Feature
If the Day Override option is turned on and the valve reaches the set Regeneration Day Override value, the Regeneration Cycle starts at the programmed regeneration time.

Flow Meter Equipped Timer
As treated water is used, the Volume Remaining display counts down from the calculated system capacity, less the reserve volume. Once capacity reaches the reserve volume, the system will regenerate based on the set regeneration time. If set for an Immediate system, the unit will regenerate immediately once it reaches zero capacity. If it is a Fixed, Variable, or Weekly reserve, the unit will queue a regeneration (RGQ) and count down Reserve Volume until the set regeneration time.

NOTE: Reserve Volume is only available in a RGQ system.

WARNING: Transformer must be grounded and ground wire must be terminated to the back plate where grounding label is located before installation.

MASTER PROGRAMMING MODE FLOW CHART

CAUTION Before entering Master Programming, please contact your local professional water dealer.
NOTE: Depending on current option settings, some displays cannot be viewed or set.

Entering Master Programming Mode
1. Press and hold the Shift and Up buttons for 5 seconds.
2. Set the Time of Day display to 12:01 P.M. or 12:01HR. Then go to the main display screen, press the Up and Down buttons at the same time for 5 seconds.

To Set Time Of Day:
1. Press and hold the Up or Down buttons for 2 seconds.
2. Press the Shift button to select the digit you want to modify.
MASTER PROGRAMMING MODE FLOW

CHART CONTINUED

Options: U.S. Format

[0.000 gal] (Default)
[0.000 L]

End of Master Programming
**MASTER PROGRAMMING MODE**

When the Master Programming Mode is entered, parameters can be set to make the timer function as needed.

**CAUTION** Before entering Master Programming, please contact your local professional water dealer.

**NOTE:** Depending on current option settings, some displays cannot be viewed or set.

**Entering Master Programming Mode:**
1. Press and hold the Shift and Up buttons for 5 seconds.
   OR
2. Set the time of day display to 12:01 PM or 12:01HR (See the User Programming section to learn how to set Time of Day). Then go to the main display screen, press the Up and Down buttons at the same time for 5 seconds.

**Exiting Master Programming Mode:**
1. Press the Extra Cycle button once per display until all are viewed. Master Programming Mode is exited and the normal display screen appears.
2. To exit the Master Programming Mode without saving, press the Diagnostic button.

**NOTE:** If no keypad activity is made for 5 minutes while in the Master Programming Mode, or if there is a power failure, no changes will be made, and the unit will go back to the main display screen.

**Resets:**
Soft Reset: Press and hold the Up and Down buttons for 25 seconds until 12:00PM (or 12:00HR) appears. This resets all parameters except for the flow meter totalizer volume.

Master Reset: Hold the Extra Cycle button while powering up the unit. This resets all of the parameters in the unit. Check and verify the choices selected in Master Programming Mode.

1. **System Type**
   This program step selects the system type.
   - Press the Up or Down buttons to adjust this value.
   - Press the Extra Cycle button.

   **SYSTEM TYPE:** 4
   **TIME CLK DELAYED**

2. **Valve Type**
   This program step selects the valve type.
   - Press the Up or Down buttons to adjust this value.
   - Press the Extra Cycle button.

   **VALVE TYPE:** 7000 XTR

3. **Regenerant Flow**
   This program step selects how the regenerant flows through the tank (must match cam). The selections available will vary depending on the previously chosen valve model.
   - Press the Up or Down buttons to adjust this value.
   - Press the Extra Cycle button.

   **REGENERANT FLOW:** DOWN FLOW

4. **Display Format**
   This program step selects the display format.
   - Press the Up or Down buttons to adjust this value.
   - Press the Extra Cycle button.

   **DISPLAY FORMAT:**
   **US - GALLONS**

5. **Unit Capacity**
   This program step selects the timer’s total capacity of hardness that can be removed.
   - Press the Shift button to select the digit you want to modify.
   - Press the Up or Down buttons to adjust this value.
   - Press the Extra Cycle button.

   **UNIT CAPACITY:** 0030000 GRAINS

6. **Feed Water (Hardness)**
   This program step is used to set the feed water hardness. The system will automatically calculate volume remaining based on the unit capacity, capacity safety factor, and feed water hardness entered.
   - Press the Shift button to select the digit you want to modify.
   - Press the Up or Down buttons to adjust this value.
   - Press the Extra Cycle button.

   **WATER HARDNESS:** 030 GPG

7. **Capacity Safety Factor**
   This program step is used to set the reserve capacity of the unit. This is a percentage by which the unit’s capacity is reduced.
   - Press the Shift button to select the digit you want to modify.
   - Press the Up or Down buttons to adjust this value.
   - Press the Extra Cycle button.

   **CAPACITY SAFETY FACTOR:** 00%

8. **Volume Override**
   This program step is used to set the volume override of the unit.
   - Press the Shift button to select the digit you want to modify.
   - Press the Up or Down buttons to adjust this value.
   - Press the Extra Cycle button.

   **VOLUME OVERRIDE:** 0001000 g
9. Regeneration Day Override
This program step sets the maximum amount of time (in days) the unit can be in service without a regeneration.
- Press the Shift button to select the digit you want to modify.
- Press the Up or Down buttons to adjust this value.
- Press the Extra Cycle button.

10. Regeneration Time
This program step sets the time of day for the regeneration to occur in delayed systems.
- Press the Shift button to select the digit you want to modify.
- Press the Up or Down buttons to adjust this value.
- Press the Extra Cycle button.

11. Regeneration Cycle Step Programming
This program step programs the Regeneration Cycle step times 1 through 6. Please refer to the chart below for regenerant flow default cycle steps and times.

<table>
<thead>
<tr>

12. Auxiliary Relay Output
The next two displays are part of a series of settings used to program the optional relay output. The first setting turns the output on/off during regeneration only. The second turns the output on during service only, every time a set volume of water used has accumulated.

NOTE: When auxiliary outputs are in the OFF (default) setting, press the Up or Down buttons to set the first setting. Then press the Extra Cycle button to advance to the second setting.

13. Timed Auxiliary Relay Output Window (Start & End Time Setting)
This option setting consists of two displays. The first display sets the turn-on time of the output, referenced to the start of the first regeneration cycle. The second display sets the output turn-off time, referenced again to the start of the first regeneration cycle. An OFF setting cancels this setting. All settings are in minutes and output timing is synchronized with regeneration cycle timing.
- Start Time: Any time during regeneration.
- End Time: At start time, and anytime during the regeneration cycle.

14. Chemical Pump Auxiliary Relay Output Window
This option setting consists of two displays. The first display sets the volume of water flow at which the output turns on. The second display sets the on time (in seconds) of the output.
- Activate output after volume set is reached.
- Press the Shift button to select the digit you want to modify.
- Press the Up or Down buttons to adjust this value.
- Press the Extra Cycle button.

15. Flow Meter Size
This program step sets the size of the flow meter.
- Press the Up or Down buttons to adjust this value.
- Press the Extra Cycle button.

16. Maximum Flow Rate
This program step sets maximum flow rate of the generic flow meter.
- Press the Shift button to select the digit you want to modify.
- Press the Up or Down buttons to adjust this value.
- Press the Extra Cycle button.

17. Pulses per Gallon/Liter
This program step sets the pulses per gallon/liter for generic flow meters.
- Press the Shift button to select the digit you want to modify.
- Press the Up or Down buttons to adjust this value.
- Press the Extra Cycle button.

18. End of Master Programming Mode
USER PROGRAMMING MODE FLOW

NOTE: Depending on current option settings, some displays cannot be viewed or set.

Entering User Mode
1. Press and hold the Up and Down buttons for 5 seconds.

2. Set Feed Water Hardness
   • Press the Shift, Up, and Down buttons to move the cursor and change the value of the numbers.
   • Press the Extra Cycle button to proceed to the next step.
   NOTE: Feed Water Hardness will not be shown in Volume Override or Time Clock system types.

3. Set Regeneration Day Override
   • To turn on and set the days, press the Down button.
   • Press the Shift, Up, and Down buttons to move the cursor and change the value of the numbers.
   • Press the Extra Cycle button to proceed to the next step.

4. Regeneration Time
   • Press the Shift, Up, and Down buttons to move the cursor and change the value of the numbers.
   • Press the Extra Cycle button

5. End of User Programming Mode

DIAGNOSTIC PROGRAMMING MODE FLOW

NOTE: Depending on current option settings, some displays cannot be viewed or set.

Entering Diagnostic Mode
1. Press and release the “D” button.
2. Press the Extra Cycle button once per display until all displays are viewed and the normal display screen appears.
3. Press and release the “D” button during this mode to exit the Diagnostic Mode.
4. Depending on current option settings, some displays cannot be viewed.
DIAGNOSTIC PROGRAMMING MODE

NOTE: Depending on current option settings, some displays cannot be viewed.

Overview Diagnostic Mode
The current Diagnostic Programming Mode screen will display until either the Extra Cycle button is pressed through for each screen, or the Diagnostic button is pressed. In the event of regeneration occurring while in the Diagnostic Programming Mode, the regeneration step and time remaining will be displayed. When regeneration completes, the display will return to the normal time of day display screen.

Entering and Exiting Diagnostic Mode
Press and release the “D” button to enter the Diagnostic Programming Mode. Pressing the Extra Cycle button will move to the next diagnostic screen. Press the Extra Cycle button once per display until all are viewed. Pressing the Diagnostic button while in Diagnostic Mode will cause the unit to leave the Diagnostic Mode and return to the normal time of day display screen.

1. Current Flow Rate
This program step displays the calculated flow rate for the timer. The below flow rates are the maximum flow rate the timer will read for each meter.
1.25 inch Turbine: 90 gpm (0.34 m³/m)
• Press the Extra Cycle button.

2. Peak Flow Rate
This program step displays the peak flow rate (1 minute average) since the last regeneration.
• Press the Extra Cycle button.

3. Totalizer
This program step displays the total volume of treated water that passes through the meter.
• Reset to zero by holding the Up and Down buttons for five seconds while in the totalizer screen.
• Press the Extra Cycle button.

4. Hours Between Last Two Regenerations
This program step displays the time between the last two regenerations saved.
• Press the Extra Cycle button.

5. Hours Since Last Regeneration
This program step displays the hours since the last regeneration.
• Press the Extra Cycle button.

6. Volume Remaining
This program step displays the volume remaining. The timer will regenerate if the volume remaining is set to zero. The maximum ranges are the same as the maximum volume calculated on the main screen.
• Press the Extra Cycle button.

7. Reserve Capacity
This program step displays the reserve capacity, ensuring soft water is available at all times.
• Press the Extra Cycle button.

8. Previous Day’s Water Usage
This program step displays the previous day’s water usage.
• Press the Extra Cycle button.

9. Software Version
This program step displays the timer’s software program version number.
• Press the Extra Cycle button to exit.

NOTE: Diagnostic Programming Mode will stop if the system goes into a regeneration.

**Not Shown**

1. 61462 By-Pass Service Kit, 7000 (Includes all internal parts for 7000 bypass assembly - bypass body not included)

Important: To bypass the valve, turn bypass knob on both sides of the valve to bypass position. When returning to service, put the inlet into service before the outlet.
### Item No. | QTY | Part No.  | Description
--- | --- | --- | ---
1 | 1 | 60014 | Safety Brine Valve Assy, 2310
2 | 1 | 60068-30 | Float Assy, 2310, w/30-inch Rod
3 | 1 | 60002-34 | Air Check, #500
TROUBLESHOOTING

Timer
If an error is detected, an error screen will alternate with the main display screen every few seconds, and the LED light will be red.

During an error condition, the unit continues to monitor the flow meter and update the remaining capacity. Once an error condition is corrected, the unit returns to the operating status it was in prior to the error, and regeneration resumes according to normal programming. If an error is cleared by reprogramming the unit in the Master Programming Mode, the volume remaining may be reset to the full unit capacity (as though it had just regenerated). If an error is present, a regeneration can only occur manually by pressing and holding the Extra Cycle button for 5 seconds. If the unit was in regeneration when the error occurred, it will complete the regeneration cycle and go into service.

When the problem is corrected, and the error no longer displays (it may take several seconds for the unit to stop displaying the error message), the unit will return to normal operation. The LED light will no longer be red, and will turn Green if the unit is regenerating, or Blue if the unit is in service.

REMOVING THE GEAR BOX ASSEMBLY

1. Unplug the power source.
2. With a 3/8 inch nut driver, turn the cycle cam counterclockwise to the position shown in the illustration above.
3. Slightly pull the two tabs outward and push the gearbox slightly upward to remove.
4. When returning the valve to service after powerhead disassembly, manually step valve through regeneration using the extra cycle button until the valve is in service.

INSERTING THE CIRCUIT BOARD

1. To insert circuit board, align notches on left side of board with flexible finger on power head. Apply pressure to left while rotating the board back.

CONNECTING THE CIRCUIT BOARD

After the circuit board is installed:

1. Connect the motor wires to the motor connector on the circuit board.
2. Connect the transformer cable to the transformer connector on the circuit board.
3. Connect the meter cable to the meter cable connector on the circuit board.
4. Connect the meter cable sensor end to the opening on the valve body.
5. Thread the meter cable and power cable along the path shown in the above illustration.
6. Insert screw to secure circuit board.
