**FOR IMMEDIATE RELEASE**

### **Pentair Hypro Unveils New ProClean II Push Valve**

NEW BRIGHTON, Minn. – September 12, 2018 – Pentair Hypro® introduces the new ProClean™ II Push Valve, designed with a self-flushing feature to minimize sticking when open or closed, even with a heavy particulate solution.

The ProClean II Push Valve releases flow by applying pressure to the rim of a container requiring the same push force to activate regardless of liquid pressure. The self-flushing feature reduces delays and the inconvenience of valve sticking that may be caused by particulate or chemical build-up, and ensures a clean container that is suitable for recycling and full utilization of the container contents.

Built with a polypropylene body and piston for durability, the new ProClean II Push Valve will replace the current version of the Push Valve, and is ideally suited to work with the ProClean, ProClean Plus and High Flow ProClean series container rinse nozzles.

The ProClean nozzles allow users to clean containers more effectively and therefore more efficiently—saving both time and water resources. The ProClean rotating nozzles place jets of water upwards and downwards to give a thorough all around rinsing action while the ProClean Plus offers a static blade nozzle for fast cleaning of persistent, sticky residues on the base of a container. The two complementary nozzle types are each designed for different situations and can be used effectively in sequence either by batch rinsing and swapping nozzles, or installing the two nozzles side by side in the chemical induction bowl.
